

# QEMU Device Properties

## Example: Rename Device

## Example: Move MSI-X

“ The QEMU vfio-pci device option is `x-msix-relocation=` which allows specifying the bar to use for the MSI-X tables, ex. `bar0...bar5`. Since this device uses a 64bit `bar0`, we can either extend that BAR or choose another, excluding `bar1`, which is consumed by the upper half of `bar0`.

To set these properties you can edit the VM configuration and add an `args` parameter.

```
args: -set device.hostpci1.x-msix-relocation=bar2
```
